(a) No budget: a safe plan that every sound rulebook omits

A sound rulebook whose verifier has n bits never certifies q: q is safe but omitted, and $|q| = n + O(1)$.

(b) Budget T: a plan that defeats every checker faster than T

A verdict that arrives before the budget runs out is wrong either way, so an always-right checker must spend about the whole budget on d_T.

(c) Simulation 1, each checker against its own plan d_T: only the checker that spends the whole budget is right
